

Constraint Programming

2019/2020 – Mini-Test #2

Wednesday, 11 December, 16:30 h in 128-Ed.II

Duration: 1.5 h (open book)

1. Interval Arithmetic

Consider the univariate polynomial function expressed in the standard form as:

$$f(x) = x^2 - 4x + 3$$

1.1. Express the function in the factored form.

$$x = \frac{4 \mp \sqrt{16 - 4(3)}}{2} = \frac{4 \mp 2}{2} = 2 \mp 1 = 1 \vee 3$$

$$\therefore f(x) = (x - 1)(x - 3) \quad \leftarrow \text{factored form}$$

1.2. Compute the mean value extension of f over the interval $[a, b]$ centered at the midpoint c .

$$F_c(x) = f(c) + F'([a, b]) \times (x - c)$$

$$c = \frac{a+b}{2}$$

$$f(c) = c^2 - 4c + 3$$

$$F'([a, b]) = 2[a, b] - 4$$

$$F_c(x) = c^2 - 4c + 3 + (2[a, b] - 4) \times (x - c)$$

1.3. Find, if possible, an interval (with width = 1) for which the natural interval evaluation of the mean value extension computes an enclosure smaller than the obtained by the factored form.

$$[a, b] = [1.5, 2.5] \quad c = 2$$

$$\begin{aligned} (x - 1)(x - 3) &= ([1.5, 2.5] - 1)([1.5, 2.5] - 3) = ([0.5, 1.5])([-1.5, -0.5]) \\ &= [-2.25, -0.25] \quad (\text{width } 2) \end{aligned}$$

$$\begin{aligned} F_c([1.5, 2.5]) &= 2^2 - 4(2) + 3 + (2[1.5, 2.5] - 4) \times ([1.5, 2.5] - 2) \\ &= 4 - 8 + 3 + ([3, 5] - 4) \times [-0.5, 0.5] \\ &= -1 + [-1, 1] \times [-0.5, 0.5] \\ &= -1 + [-0.5, 0.5] = [-1.5, -0.5] \quad (\text{width } 1) \end{aligned}$$

1.4. Prove the inclusion monotonicity property of the interval arithmetic square operator.

$$\text{Prove: } [a, b] \subseteq [c, d] \Rightarrow [a, b]^2 \subseteq [c, d]^2$$

$$[a, b] \subseteq [c, d] \Rightarrow c \leq a \leq b \leq d$$

Case $0 \leq c$

$$[a, b]^2 = [a^2, b^2]$$

$$[c, d]^2 = [c^2, d^2]$$

$$0 \leq c \leq a \Rightarrow c^2 \leq a^2$$

$$0 \leq b \leq d \Rightarrow b^2 \leq d^2$$

$$\therefore [a, b]^2 \subseteq [c, d]^2$$

Case $c < 0 \leq a$

$$[a, b]^2 = [a^2, b^2]$$

$$[c, d]^2 = [0, \max(c^2, d^2)]$$

$$0 \leq a \Rightarrow 0 \leq a^2$$

$$0 \leq b \leq d \Rightarrow b^2 \leq d^2$$

$$\therefore [a, b]^2 \subseteq [c, d]^2$$

Case $a < 0 \leq b$

$$[a, b]^2 = [0, \max(a^2, b^2)]$$

$$[c, d]^2 = [0, \max(c^2, d^2)]$$

$$c \leq a < 0 \Rightarrow a^2 \leq c^2$$

$$0 \leq b \leq d \Rightarrow b^2 \leq d^2$$

$$\therefore [a, b]^2 \subseteq [c, d]^2$$

Case $b < 0 \leq d$

$$[a, b]^2 = [b^2, a^2]$$

$$[c, d]^2 = [0, \max(c^2, d^2)]$$

$$0 \leq b^2$$

$$c \leq a < 0 \Rightarrow a^2 \leq c^2$$

$$\therefore [a, b]^2 \subseteq [c, d]^2$$

Case $d < 0$

$$[a, b]^2 = [b^2, a^2]$$

$$[c, d]^2 = [d^2, c^2]$$

$$b \leq d < 0 \Rightarrow d^2 \leq b^2$$

$$c \leq a < 0 \Rightarrow a^2 \leq c^2$$

$$\therefore [a, b]^2 \subseteq [c, d]^2$$

Thus, for all possible cases: $[a, b]^2 \subseteq [c, d]^2$

$\therefore [a, b] \subseteq [c, d] \Rightarrow [a, b]^2 \subseteq [c, d]^2$ q.e.d.

2. Interval Newton

Consider the function: $f(x) = (x - 1)^2 - e^{x-3}$

2.1. Define the interval Newton function for the polynomial.

$$N([a, b]) = c - \frac{f(c)}{F'([a, b])} \quad \text{with} \quad c = \frac{a + b}{2}$$

$$f(c) = (c - 1)^2 - e^{c-3}$$

$$F'([a, b]) = 2([a, b] - 1) - e^{[a, b]-3}$$

$$\therefore N([a, b]) = c - \frac{(c-1)^2 - e^{c-3}}{2([a, b]-1) - e^{[a, b]-3}}$$

2.2. Evaluate the interval Newton function in $[0.4, 0.8]$ and in $[0.8, 1.2]$.

$$\begin{aligned} N([0.4, 0.8]) &= 0.6 - \frac{(0.6 - 1)^2 - e^{0.6-3}}{2([0.4, 0.8] - 1) - e^{[0.4, 0.8]-3}} \\ &= 0.6 - \frac{0.0693}{[-1.2, -0.4] - [e^{-2.6}, e^{-2.2}]} = 0.6 - \frac{0.0693}{[-1.3108, -0.4743]} \\ &= 0.6 - [-0.1461, -0.0529] = [0.6529, 0.7461] \end{aligned}$$

$$\begin{aligned} N([0.8, 1.2]) &= 1 - \frac{(1 - 1)^2 - e^{1-3}}{2([0.8, 1.2] - 1) - e^{[0.8, 1.2]-3}} \\ &= 1 - \frac{-e^{-2}}{[-0.4, 0.4] - [e^{-2.2}, e^{-1.8}]} = 1 - \frac{-e^{-2}}{[-0.5653, 0.2892]} \\ &= 1 - ([-\infty, -0.4679] \cup [0.2394, +\infty]) = [-\infty, 0.7606] \cup [1.4679, +\infty] \end{aligned}$$

2.3. From the above evaluations what can be concluded with respect to the existence of roots within those intervals.

$$N([0.4, 0.8]) = [0.6529, 0.7461] \subset [0.4, 0.8] \Rightarrow \text{There is at least one root in } [0.4, 0.8]$$

$$N([0.8, 1.2]) \cap [0.8, 1.2] = ([-\infty, 0.7606] \cup [1.4679, +\infty]) \cap [0.8, 1.2] = \emptyset \Rightarrow \text{There are no roots in } [0.8, 1.2]$$

3. Constraint Propagation

Consider the constraints below and a box $B = [2, 3] \times [3, 5]$

$$c1: (x - 4)^2 - y \leq -1$$

$$c2: x^2 - 4x + y \leq 0$$

3.1. Is the system hull-consistent in box B ?

hull-consistent in $[2, 3] \times [3, 5]$

$$\Leftrightarrow \exists y \in [3, 5] (2 - 4)^2 - y \leq -1 \wedge \exists y \in [3, 5] 2^2 - 4(2) + y \leq 0$$

$$\wedge \exists y \in [3, 5] (3 - 4)^2 - y \leq -1 \wedge \exists y \in [3, 5] 3^2 - 4(3) + y \leq 0$$

$$\wedge \exists x \in [2, 3] (x - 4)^2 - 3 \leq -1 \wedge \exists x \in [2, 3] x^2 - 4x + 3 \leq 0$$

$$\wedge \exists x \in [2, 3] (x - 4)^2 - 5 \leq -1 \wedge \exists x \in [2, 3] x^2 - 4x + 5 \leq 0$$

Consider: $x^2 - 4x + 5$, it is nondecreasing in $[2, 3]$ since its derivative $2x - 4$ is non negative in $[2, 3]$ and positive in 3. Therefore:

$$\forall x \in [2, 3] 2^2 - 4(2) + 5 \leq x^2 - 4x + 5 \leq 3^2 - 4(3) + 5$$

$$\forall x \in [2, 3] 1 \leq x^2 - 4x + 5 \leq 2$$

$$\therefore \nexists x \in [2, 3] x^2 - 4x + 5 \leq 0$$

Thus the system is not hull-consistent in $[2, 3] \times [3, 5]$

3.2. Is the system box-consistent in box B ?

box-consistent in $[2, 3] \times [3, 5] \Leftrightarrow$ the following inequalities are satisfiable:

$$(2 - 4)^2 - [3, 5] \leq -1 \wedge 2^2 - 4(2) + [3, 5] \leq 0$$

$$\wedge (3 - 4)^2 - [3, 5] \leq -1 \wedge 3^2 - 4(3) + [3, 5] \leq 0$$

$$\wedge ([2, 3] - 4)^2 - 3 \leq -1 \wedge [2, 3]^2 - 4[2, 3] + 3 \leq 0$$

$$\wedge ([2, 3] - 4)^2 - 5 \leq -1 \wedge [2, 3]^2 - 4[2, 3] + 5 \leq 0$$

$$\begin{aligned} &\Leftrightarrow 4 - [3,5] \leq -1 \wedge 4 - 8 + [3,5] \leq 0 \\ &\wedge 1 - [3,5] \leq -1 \wedge 9 - 12 + [3,5] \leq 0 \\ &\wedge [1,4] - 3 \leq -1 \wedge [4,9] - [8,12] + 3 \leq 0 \\ &\wedge [1,4] - 5 \leq -1 \wedge [4,9] - [8,12] + 5 \leq 0 \end{aligned}$$

$$\begin{aligned} &\Leftrightarrow [-1,1] \leq -1 \wedge [-1,1] \leq 0 \\ &\wedge [-4,-2] \leq -1 \wedge [0,2] \leq 0 \\ &\wedge [-2,1] \leq -1 \wedge [-5,4] \leq 0 \\ &\wedge [-4,-1] \leq -1 \wedge [-3,6] \leq 0 \end{aligned}$$

Since all inequalities are trivially satisfiable the system is box-consistent in $[2,3] \times [3,5]$

3.3. Can you reduce box B by applying HC4-revise on both constraints? Justify.

HC4-revise enforces hull-consistency in the decomposed system of primitive constraints which is weaker than box-consistency enforced on the original constraints. Since the system is already box-consistent in box B , the box cannot be reduced by applying the weaker HC4-revise.

3.4. Apply HC4-revise to constraint $c1$ with an initial box $B' = [2,3] \times [0,2]$.

Forward evaluation:

Backward propagation:

The resulting box is $[3] \times [2]$.

3.5. What is the box obtained by applying BC3-revise on both constraints with the initial box B' ?

BC3-revise enforces box-consistency on the original system of constraints and is stronger than HC4-revise. We have seen in the previous question that applying HC4-revise to constraint $c1$ results in box $[3] \times [2]$. Since $x=3, y=2$ is a solution of the system:

$$c1: (3 - 4)^2 - 2 \leq -1 \Leftrightarrow 1 - 2 \leq -1 \Leftrightarrow -1 \leq -1 \quad (\text{True})$$

$$c2: 3^2 - 4(3) + 2 \leq 0 \Leftrightarrow 9 - 12 + 2 \leq 0 \Leftrightarrow -1 \leq 0 \quad (\text{True})$$

applying HC4-revise on the system cannot discard it and the result is the box $[3] \times [2]$. Therefore for any stronger method, such as BC3-revise, the result will be the same: $[3] \times [2]$.
